October 20, 2019

Actions to Stop Doing:

The team is functioning well. No unhealthy habits have been developed. We did lose a member early on, which could significantly hurt the team if we lose anymore.

Actions to Start Doing:

The team should start having more meetings together to discuss tasks to be completed as well as discuss progress that has been made/needs to be made.

Actions to Keep Doing:

The team should keep communicating as well as they have, it greatly helps moving the product forward.

The team should keep being responsive and making sure everything is getting completed in a timely manner

The team should keep researching and learning the technologies that will be utilized in this project as well as they are doing now.

Work Completed/Not Completed:

All of the team members have researched React to gain a basic understanding of the syntax and implementation.

Team members spent the Sprint time learning how to use Firebase and researching tutorials in order to integrate Firebase into the web page.

A basic login page was created that allows a user to create an account and then login with their credentials. However, there are some limitations due to the lack of a backend component.

We have not implemented a database through Firebase into our web page, which was integral to three of the tasks in Sprint 1. These tasks will be added to the product backlog and Sprint 2 and will be addressed with the knowledge the team spent gathering during Sprint 1.

Work Completion Rate:

We completed half of one of the 2 user stories we hoped to complete. We were able to complete a login page however we still need to create a sign up page as well as link these things to a database.

A lot of this sprint was dedicated to learning technologies that we will be using including React and Firebase. As a team we completed 30 work hours and the majority of this time was used to learn React and Firebase.
